

1、mogondb安装

2、mongod创建单个分片的副本集

192.168.4.123

(1) 建立数据文件夹和日志文件夹

```
#cd /usr/local/mongodb
```

```
#mkdir conf
```

```
#mkdir -p dbs/{master,slave,arbiter}
```

```
#mkdir -p logs/{master,slave,arbiter}
```

(2) 建立配置文件

```
#master.conf
```

```
dbpath=/usr/local/mongodb/dbs/master
```

```
logpath=/usr/local/mongodb/logs/master/mongodb.log
```

```
pidfilepath=/var/run/mongo_master.pid
```

```
logappend=true
```

```
replSet=mongodb1
```

```
port=10002
```

```
oplogSize=10000
```

```
fork=true
#noprealloc=true
profile=1
slowms=200
```

```
#slave.conf
```

```
dbpath=/usr/local/mongodb/dbs/slave
logpath=/usr/local/mongodb/logs/slave/slave.log
pidfilepath=/var/run/mongo_slave.pid
logappend=true
replSet=mongodb1
port=10001
oplogSize=10000
fork=true
#noprealloc=true
profile=1
slowms=200
```

```
#arbiter.conf
```

```
dbpath=/usr/local/mongodb/dbs/arbiter
logpath=/usr/local/mongodb/logs/arbiter/mongodb.log
pidfilepath=/var/run/mongo_arbiter.pid
logappend=true
replSet=mongodb1      ##三台服务器副本集名字不相同
port=10000
oplogSize=10000
fork=true
#noprealloc=true
profile=1
slowms=200
```

(3) 启动每个mongod

```
#/etc/init.d/mongod_master start
```

```
#/etc/init.d/mongod_slave start
```

```
#/etc/init.d/mongod_arbiter start
```

(4) 配置主备仲裁节点

```
#mongod IP:10002
```

```
>use admin
```

```
>config={_id:"mongodb1",members:[
```

```
...{_id:0,host:"ip1:10002",priority:10},
```

```
...{_id:0,host:"ip2:10001",priority:5},
```

```
...{_id:0,host:"ip3:10000",arbiterOnly:true}]
```

```
...}
```

```
rs.initiate(config) #初始化配置
```

```
rs.status() #查看集群状态
```

3、 mongod创建单个分片的配置服务器

(1) 创建配置目录

三台

```
mkdir /usr/local/mongodb/dbs/config
```

(2) 配置文件

```
#config.conf
```

```
dbpath=/usr/local/mongodb/dbs/config
```

```
logpath=/usr/local/mongodb/logs/config/mongodb.log
```

```
pidfilepath=/var/run/mongo_config.pid
```

```
directoryperdb=true
```

```
logappend=true
```

```
port=10003
```

fork=true

configsvr=true

(3) 启动配置服务器

#/etc/init.d/mongodb_config start

4、Mongod创建并配置mongos和开启分片模式

(1) 创建日志目录

#mkdir /usr/local/mongodb/logs/mongos

(2) 配置文件

#mongos.conf

logpath=/dbsoft/mongodb/logs/mongos/mongodb.log

pidfilepath=/var/run/mongo_mongos.pid

logappend=true

port=10004

fork=true

configdb=192.168.4.123:10003,192.168.4.124:10003,192.168.4.104:10003

必须是单数

(3) 启动mongos

#/etc/init.d/mongodb_mongos start

(4) 配置分片

连接mongos

> sh,addShard("mongodb1/ip1:10002") #三台服务器Ip和三个副本集

> sh,addShard("mongodb2/ip2:10002")

> sh,addShard("mongodb3/ip3:10002")

> sh.enableSharding("数据库名") ##某个数据库启用分片

> db.runCommand({"shardcollection":"foo.bar","key":{"_id":1}}) ## bar为表, 1为启用分片

> db.printShardingStatus() #查看分片状态

```
> sh.status({verbose:true})
```

```
> sh.status()
```

5、脚本

mongodb.zip
98.57KB
